## Information About Network Access Server Identifier

Network access server identifier (NAS-ID) is used to notify the source of a RADIUS access request, which enables the RADIUS server to choose a policy for that request. You can configure one on each WLAN profile, or VLAN interface. The NAS-ID is sent to the RADIUS server by the embedded wireless controller through an authentication request to classify users to different groups. This enables the RADIUS server to send a customized authentication response.

---

**Note** The acct-session-id is sent with the RADIUS access request only when accounting is enabled on the policy profile.

---

If you configure a NAS-ID for a WLAN profile, it overrides the NAS-ID that is configured for the VLAN interface.

The following options can be configured for a NAS ID:

- sys-name (System Name)
- sys-ip (System IP Address)
- sys-mac (System MAC Address)
- ap-ip (AP's IP address)
- ap-name (AP's Name)
- ap-mac (AP's MAC Address)
- ap-eth-mac (AP's Ethernet MAC Address)

- ap-policy-tag (AP's policy tag name)
- ap-site-tag (AP's site tag name)
- ssid (SSID Name)
- ap-location (AP's Location)

## Creating a NAS ID Policy(GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Security > Wireless AAA Policy**.
- Step 2** On the **Wireless AAA Policy** page, click the name of the **Policy** or click **Add** to create a new one.
- Step 3** In the **Add/Edit Wireless AAA Policy** window that is displayed, enter the name of the policy in the **Policy Name** field.
- Step 4** Choose from one of the NAS ID options from the **Option 1** drop-down list.
- Step 5** Choose from one of the NAS ID options from the **Option 2** drop-down list.
- Step 6** Choose from one of the NAS ID options from the **Option 3** drop-down list.
- Step 7** Save the configuration.
- 

## Creating a NAS ID Policy

Follow the procedure given below to create NAS ID policy:

### Before you begin

- NAS ID can be a combination of multiple NAS ID options; the maximum options are limited to 3.
- The maximum length of the NAS ID attribute is 253. Before adding a new attribute, the attribute buffer is checked, and if there is no sufficient space, the new attribute is ignored.
- By default, a wireless aaa policy (default-aaa-policy) is created with the default configuration (sys-name). You can update this policy with various NAS ID options. However, the default-aaa-policy cannot be deleted.
- If a NAS ID is not configured, the default sys-name is considered as the NAS ID for all wireless-specific RADIUS packets (authentication and accounting) from the embedded wireless controller.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b>	Enters global configuration mode.

	Command or Action	Purpose
	Device# configure terminal	
<b>Step 2</b>	<b>wireless aaa policy <i>policy-name</i></b> <b>Example:</b> Device(config)# wireless aaa policy test	Configures a new AAA policy.
<b>Step 3</b>	<b>nas-id option1 sys-name</b> <b>Example:</b> Device(config-aaa-policy)# nas-id option1 sys-name	Configures NAS ID for option1.
<b>Step 4</b>	<b>nas-id option2 sys-ip</b> <b>Example:</b> Device(config-aaa-policy)# nas-id option2 sys-ip	Configures NAS ID for option2.
<b>Step 5</b>	<b>nas-id option3 sys-mac</b> <b>Example:</b> Device(config-aaa-policy)# nas-id option3 sys-mac	Configures NAS ID for option3.

## Attaching a Policy to a Tag (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > Tags** page, click **Policy** tab.
  - Step 2** Click **Add** to view the **Add Policy Tag** window.
  - Step 3** Enter a name and description for the policy tag.
  - Step 4** Click **Add** to map WLAN profile and Policy profile.
  - Step 5** Choose the **WLAN Profile** to map with the appropriate **Policy Profile**, and click the tick icon.
  - Step 6** Click **Save & Apply to Device**.
- 

## Attaching a Policy to a Tag (CLI)

Follow the procedure given below to attach a NAS ID policy to a tag:

**Procedure**

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b> <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-name</i></b> <b>Example:</b> Device(config)# wireless profile policy test1	Configures a WLAN policy profile.
<b>Step 3</b>	<b>aaa-policy <i>aaa-policy-name</i></b> <b>Example:</b> Device(config-wireless-policy)# aaa-policy policy-aaa	Configures a AAA policy profile.
<b>Step 4</b>	<b>exit</b> <b>Example:</b> Device(config-wireless-policy)# exit	Returns to global configuration mode.
<b>Step 5</b>	<b>wireless tag policy <i>policy-tag</i></b> <b>Example:</b> Device(config)# wireless tag policy policy-tag1	Configures a wireless policy tag.
<b>Step 6</b>	<b>wlan wlan1 policy <i>policy-name</i></b> <b>Example:</b> Device(config)# wlan wlan1 policy test1	Maps a WLAN profile to a policy profile.  <b>Note</b> You can also use the <b>ap-tag</b> option to configure a NAS ID for an AP group, which will override the NAS ID that is configured for a WLAN profile or the VLAN interface.

## Verifying the NAS ID Configuration

Use the following **show** command to verify the NAS ID configuration:

```
Device# show wireless profile policy detailed test1
```

```
Policy Profile Name      : test1
Description              :
Status                   : ENABLED
VLAN                     : 1
Client count             : 0

:
:
AAA Policy Params
  AAA Override           : DISABLED
```

```
NAC : DISABLED
AAA Policy name : test
```
